## Table of Contents

Programming is the art of creating innovative solutions in the form of computer programs for solving problems that vary across a wide spectrum of fields, ranging from classic mathematical puzzles and everyday life issues to weather forecasting and seeking and understanding novel marvels across the cosmos.

Although programming and coding are typically used interchangeably, programming is not just coding. Coding represents that part of programming, which involves writing computer code.

Programming, on the other hand, is a wider process that also involves the approach of coming up with ideas to develop a program as well as the testing of the same and much more. Check out this detailed coding vs. programming (<https://hackr.io/blog/coding-vs-programming-difference-you-should-know>) comparison.
